

CT Scan Report – Thorax (Synthetic Sample)

Patient Information

Patient ID: XJ-20491
Age: 52 years
Sex: Male

Technique

Contrast-enhanced CT scan of the thorax performed with axial, coronal, and sagittal reconstructions.

Findings

A spiculated soft tissue density lesion measuring approximately 3.4 x 2.8 cm is seen in the left upper lobe. Associated mediastinal lymphadenopathy is noted.

Impression

Findings are suggestive of a malignant neoplasm of the left lung with possible nodal involvement.

Recommendation

Histopathological confirmation and oncological consultation are recommended.
